

ABSTRACT

The present invention provides methods for configuring a printer template and a ticket printer having a configurable template. Template attributes are received at the printer and stored in printer memory. A processor at the printer creates a template from the template attributes. Print data is provided to the printer memory. The print data is merged into the template to create a composite image. The composite image can then be printed on a substrate. The substrate may comprise a receipt, a lottery ticket, a coupon, a bus ticket, an airplane ticket, a train ticket, a gaming voucher, a slot machine voucher, or the like.
